

Assembly instruction

START GATE FIS

The competition and training gate

The Start Gate FIS is made of aluminium. This makes the system stable and particularly light weight. The start gate consists of a single launch site. On the one hand it is intended as a training facility for winter and summer and on the other hand for parallel competitions as a light weight alternative to the Start Gate WC.

Incomplicated transport and assembly

The Start Gate FIS is almost completely assembled from the start. It can be assembled and disassembled easily in just a few steps. Due to its low weight, transport is easy and comfortable. In addition, the gate can simply be folded together and stowed in the transport bag.

Trigger

The start can be triggered manually or electronically. Together with our electronic control systems it forms a complete setup for competition and training measures. Through the use of the random system it is for example also possible to trigger the start signal in the training itself. Thus an optimal start training can be completed.

Electronic setup

Please note: the electronic part plug number should be the same as the control socket number (Number in the cable to the same number in the black box).
